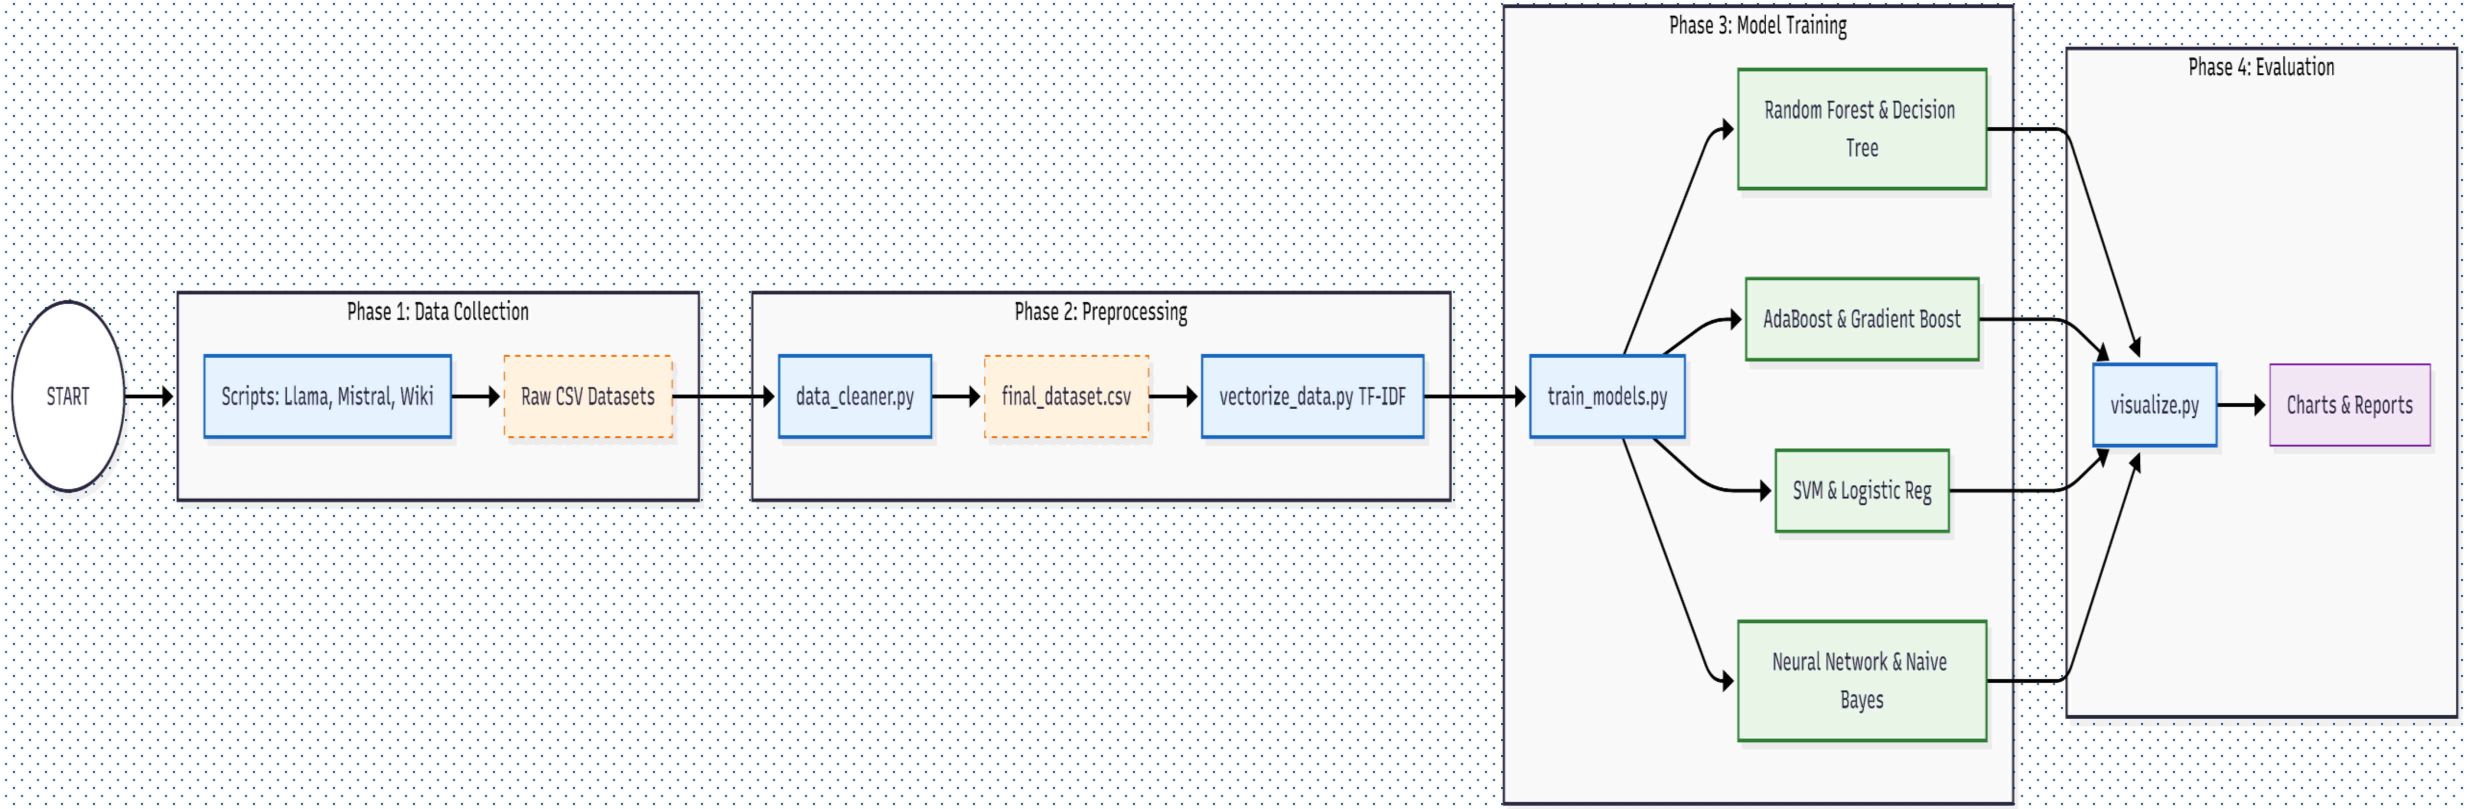
ML Pipeline



START
Phase 1: Data Collection
Scripts: Llama, Mistral, Wiki
Raw CSV Datasets
Phase 2: Preprocessing
data_cleaner.py
final_dataset.csv
vectorize_data.py TF-IDF
Phase 3: Model Training
train_models.py
Random Forest & Decision Tree
AdaBoost & Gradient Boost
SVM & Logistic Reg
Neural Network & Naive Bayes
Phase 4: Evaluation
visualize.py
Charts & Reports

with a focus on machine learning, deep learning, and data-driven decision-making systems. By analyzing current applications across domains such as healthcare, education, transportation, and scientific research, the study highlights both the capabilities and limitations of contemporary AI technologies. In addition, ethical considerations—including bias, transparency, privacy, and accountability—are discussed to emphasize the importance of responsible AI design and deployment. The paper argues that while AI offers significant potential to enhance efficiency, accuracy, and innovation, its long-term impact depends on interdisciplinary collaboration among technologists, policymakers, and educators. Understanding AI not only as a technical system but also as a social and ethical construct is essential for ensuring its benefits are distributed equitably and sustainably.
